

JHON ALVARADO ACHATA

Data Engineer | Data Platform Architect

LinkedIn | Portfolio | GitHub | Email

PROFILE

Data Engineer with experience designing and delivering scalable data platforms, ingestion pipelines, and analytics solutions in Azure. Builds reliable batch and incremental data workflows with Azure Data Factory, Azure Databricks, Microsoft Fabric, OneLake, Delta Lake, Parquet, SQL Server, and Azure SQL, transforming operational data into trusted datasets for reporting and business decision-making. Strong background in Python, REST API integration, data modeling, data validation, automation, and Power BI. Also experienced in backend and serverless development, translating business requirements into secure, maintainable, and high-impact data solutions.

EMPLOYMENT HISTORY

Data Platform Architect & Backend Lead — May 2020 - May 2026

- Architected scalable data platforms and backend solutions connecting operational systems, cloud services, analytics, and AI-powered automation.
- Designed parallel and metadata-driven ingestion pipelines with Azure Data Factory, Azure Databricks, Parquet, and Delta Lake, supporting full and incremental loading patterns.
- Built API-driven integrations and serverless services with Azure Functions, Azure SQL, SharePoint, FastField, and Azure Storage.
- Implemented Microsoft Fabric and OneLake architectures with governed workspace identities, service principals, and reusable lakehouse patterns.
- Developed operational analytics solutions with Power BI Embedded, SQL Server, R, Leaflet, and custom visualizations for mining, fleet, and process data.
- Automated infrastructure updates and multi-environment deployments using PowerShell, Azure DevOps, ADF REST APIs, and CI/CD workflows.
- Delivered AI-enabled workflows using Copilot Studio, Azure AI Foundry, Power Automate, Microsoft Teams, and Azure Functions.

TECHNICAL SKILLS

Data Engineering

Azure Data Factory | Azure Databricks | Microsoft Fabric | Delta Lake

Analytics & BI

Power BI | Power BI Embedded | Data Modeling | R | Leaflet

Cloud & DevOps

Azure Functions | Azure SQL | Azure Storage | DevOps | PowerShell

Programming & Integration

Python (PySpark) | SQL | REST APIs | .NET | Flask | React

CERTIFICATES

Microsoft Certified: Azure Databricks Data Engineer Associate — November 7, 2026

Microsoft

Validates the ability to design and implement data engineering solutions with Azure Databricks, including data ingestion, transformation, orchestration and governance.

Foundational C# with Microsoft — September 26, 2024

freeCodeCamp

Demonstrates foundational programming knowledge in C#, including variables, control flow, methods, object-oriented programming and .NET development concepts.

FEATURED PROYECTS

✤ SQL Parallel Ingestion Platform

Technologies: Azure Data Factory, Databricks, PySpark, SQL Server, Oracle, Delta Lake.
Designed and implemented a reusable ingestion foundation for SQL Server and Oracle sources, orchestrating parallel workloads into cloud storage and lakehouse formats.
Separated full-copy and incremental loading patterns with parameterized datasets and reusable Databricks notebooks, enabling consistent ingestion across environments.

✤ Metadata-Driven SharePoint to Delta Lake

Technologies: Azure Data Factory, SharePoint, Blob Storage, Databricks, Delta Lake.
Built a metadata-driven framework that converts SharePoint Excel definitions into configurable full or incremental Delta Lake tables.
Automated source filtering, file staging and notebook execution through reusable parent and child pipelines, reducing hard-coded ingestion logic for new sources.

✤ Databricks Operations Analytics App

Technologies: Databricks Apps, Streamlit, SQL Warehouse, AI Genie, Python.
Designed and deployed an interactive application that compares five operational cases through parallel-coordinate analytics and configurable filters.
Added a natural-language AI Genie experience over governed data, providing business users with a second path to explore operational insights.

✤ FastField Forms Data Integration

Technologies: C# .NET Azure Functions, FastField API, Azure Data Factory, Azure SQL.
Implemented an end-to-end integration that extracts historical and recurring FastField submissions through a C# Azure Function orchestrated by Azure Data Factory.
Automated relational table generation for dozens of forms, separating photo, list and multi-value fields into related structures for reporting and downstream analytics.

✤ Mining Fleet Geospatial Analytics

Technologies: SQL Server, R, Leaflet, Power BI, pbiviz.
Developed a geospatial workflow that transforms UTM coordinates and prepares mining haul-cycle data for operational mapping.
Delivered interactive truck routes, loading and dumping locations in a published Power BI app, turning fleet data into an operational decision-support view.

✤ Microsoft Fabric Lakehouse Sensor Heatmap with OneLake Shortcut

Technologies: Microsoft Fabric, Azure Blob Storage, Delta Lake, OneLake Shortcuts, Fabric Lakehouse, Fabric notebooks, Python.
A Microsoft Fabric data engineering workflow that connects Blob Storage Delta tables to a Lakehouse through a OneLake shortcut and uses a Fabric notebook to visualize and analyze sensor measurements with a heatmap.

✤ Copilot Studio Image Agent with Azure AI Foundry

Technologies: Microsoft Copilot Studio, Azure AI Foundry, Power Automate, Azure Blob Storage, Microsoft Teams, HTTP API, Base64.
A conversational image-generation agent built in Microsoft Copilot Studio. The agent captures a user's image request, calls an Azure AI Foundry HTTP API, processes the Base64 response through Power Automate, stores the image in Azure Blob Storage and returns the generated image URL to Copilot Studio and Microsoft Teams.
